

Training

At our training sessions, we comprehensively qualify your employees to use our technologies and machines. We will train you in our training rooms in Karlsbad, as required, or at your premises on request.

To accompany the project our specialists teach **application–orientated** knowledge about our **technologies**, as well as their principle, functions and possibilities, in theory training courses. You benefit from our many years' experience and special know–how in the field of plastics processing. We will rapidly introduce your employees, project planners and designers in a practical way to subjects, such as:

- The principle and function of **ultrasonic** and its components
- Various welding methods and connecting technologies
- Materials and their welding properties
- Design of welds, sonotrodes and workpiece holders
- Design guidelines

We adapt the training courses to the needs of the respective participants.

In order to guarantee smooth running of the machines, we familiarise the subsequent operators with the functions of the machines in practical training courses. We also instruct our customers in how to **maintain** the machines.
